

HAIR RESTORATION

When used with platelet-rich plasma, the **Eclipse MicroPen** can stimulate a renewed blood supply and proper nutrients to deprived hair follicles, which can work to restore the hair growth process. The renewed growth helps fill in areas of receding or thinning hair. PRP is a natural serum derived directly from your own cells to initiate regeneration.

A numbing agent can be applied to the desired treatment area to maximize patient comfort. The scalp may be tender for up to 24 hours after treatment, but this should quickly subside.

One treatment per month for up to three months is typically required for optimal results, and long-lasting results can be maintained with follow up treatments every 6 to 12 months.
